NOTES:

1. This wiring diagram describes the standard electronic control scheme for use with an electromechanical starter. For details of standard modifications, refer to Product Form 160.49-PW13.

2. Field wiring to be in accordance with the National Electrical Code as well as all other applicable codes and specifications. See Product Drawing Form 160.49-PW10 for field wiring connections.

3. Numbers along the left side of diagram are line identification numbers. The numbers along the right side indicate the line number location of relay contacts. An underlined contact location signifies a normally closed contact.

4. Main control panel Class 1 field wiring terminal connection points are indicated by numbers within a rectangle, i.e. 15 . Main control panel factory wiring terminal connection points are indicated by numbers within a triangle, i.e. 5 . Component terminal markings are indicated by numbers within a circle, i.e. C1 . Numbers adjacent to circuit lines are the circuit identification numbers.

5. To cycle unit on and off automatically with contacts other than those shown, install a cycling device between terminals 1 & 13 (line 27) (see note 9). If a cycling device is installed, jumper must be removed between terminals 1 & 13 .

6. Compressor motor starter with starter interlock contacts (rated 0.5 to 1.0 amp @ 24 volts A.C.) must be per Form 160.45-PA5.1. Control panel shall be grounded.

7. Units installed in Canada must have a field supplied CSA approved 30 amp disconnect switch and a 20 amp dual element fuse mounted external to control panel for 115 volt control supply.

8. To stop unit and not permit it to start again, install a stop device between terminals 1 & 8 (Line 23 (see note 9). A remote start-stop switch may be connected to terminals 1, 7 & 8 (Lines 22 & 23) (see note 9). Remote start-stop switch (Line 22) is operative only in the “Remote” operating mode.

9. Device contact rating to be 5 milliamperes at 115 volts A.C.

10. _____

11. Contact rating is 5 amps resistive at 120 volts A.C. or 240 volts A.C.

12. Three phase oil pump must be properly phased. L1, L2 & L3 corresponding to phase sequence A, B & C.

13. To check motor rotation on initial start-up, install momentary switch between terminals 24 & 25 (Line 35). Depress start switch. After approx. 30 seconds, jog motor with momentary switch. When proper rotation is obtained, replace momentary switch with jumper. Switch must have a minimum contact rating of 2 FLA, 10 LRA at 115 volts A.C.

14. Solid state motor overload (CM) is set to trip at 105% FLA. During momentary power interruption (Power Fault), contact opens for 1 second.

15. For high and low voltage units, the factory supplied jumper between 1 & 53 must be removed when electromechanical starter overloads and/or safety devices are used. For high voltage (2300-4160) UL and CSA approved units only, electromechanical compressor motor starter overloads (normally closed) must be connected between 1 & 53 .

16. Contact rating is 5 amps resistive @ 250 volts A.C. & 30 volts D.C., 2 amp inductive (.4 PF) @ 250 volts A.C. & 30 volts D.C.

17. Each 115 VAC field-connected inductive load: i.e., relay coil, motor starter coil, etc., shall have a transient suppressor wired in parallel with its coil, physically located at the coil. Spare transient suppressors and control circuit fuses are supplied in a bag attached to the top of the hinged panel.
