Subject: New Bellows Style Shaft Seal for YDTJ & LTJ/YTJ Compressors		

Part Number Information

Starting in February of 2003, YORK began using a new bellows style shaft seal on all manufactured YDTJ compressors. This bellows style seal was very successful during field-testing and this seal is now available to be retrofitted into existing compressors of this style. The new seal can also be installed in LTJ/YTJ compressors. To use this new seal it is necessary to order the following retrofit kit part numbers:

For YDTJ Compressors: **464-50720-000**

For LTJ/YTJ Compressors: **464-50721-000**

Included in the kit is everything needed to complete the conversion along with a drawing that explains how to assemble the new seal.

In addition to the retrofit kit we have developed a maintenance kit for use on compressors supplied with the bellows style shaft seal or that have been retrofitted. The maintenance kit part number used on both the YDTJ and LTJ/YTJ compressors that have the bellow seal is: **464-50722-000**. This kit will have everything included in the retrofit kit except for the cover plate and the installation drawing.

If you have an YDTJ or LTJ/YTJ compressor which has a leaking shaft seal, we are strongly recommending that you consider changing to this new style seal.
